

## IN THE SPECIFICATION

In paragraph 21, please change “transducers” to “an array of elements,” “probe” to “transducer,” and “transducers” to “elements” as follows:

[0021] FIG. 1 illustrates a block diagram of an ultrasound system 100 formed in accordance with an embodiment of the present invention. The ultrasound system 100 includes a transmitter 102 which drives ~~transducers~~ an array of elements 104 within a ~~probe transducer~~ 106 to emit pulsed ultrasonic signals into a body. A variety of geometries may be used. The ultrasonic signals are back-scattered from structures in the body, like blood cells or muscular tissue, to produce echoes which return to the ~~transducers~~ elements 104. The echoes are received by a receiver 108. The received echoes are passed through a beamformer 110, which performs beamforming and outputs an RF signal. The RF signal then passes through an RF processor 112. Alternatively, the RF processor 112 may include a complex demodulator (not shown) that demodulates the RF signal to form IQ data pairs representative of the echo signals. The RF or IQ signal data may then be routed directly to RF/IQ buffer 114 for temporary storage.

In paragraph 23, please change “probe” to “transducer” as follows:

[0023] FIG. 2 illustrates an ultrasound system formed in accordance with one embodiment of the present invention. The system includes a ~~probe-transducer~~ 10 connected to a transmitter 12 and a receiver 14. The ~~probe-transducer~~ 10 transmits ultrasonic pulses and receives echoes from structures inside of a scanned ultrasound volume 16. Memory 20 stores ultrasound data from the receiver 14 derived from the scanned ultrasound volume 16. The volume 16 may be obtained by various techniques (e.g., 3D scanning, real-time 3D imaging, volume scanning, 2D scanning with transducers having positioning sensors, freehand scanning using a Voxel correlation technique, 2D or matrix array transducers and the like).

In paragraph 28, please change “probe” to “transducer” and “transducers” to “elements” as follows:

[0028] The ~~probe-transducer~~ 10 is held in one position throughout the acquisition, and is positioned to acquire data representative of the item of interest, such as the fetal heart. The ~~transducers~~ elements 104, or array of ~~transducers~~ elements 104, are electronically or mechanically focussed to direct ultrasound firings longitudinally to scan along adjacent scan planes, and external position sensing is not necessary.

In paragraph 30, please change “transducers” to “elements” as follows:

[0030] Alternatively, the acquisition sweep may have an acquisition time period

covering multiple movement cycles, and the sweep angle 162 may be changed to reflect the type and/or size of anatomy being scanned. An acquisition with a longer acquisition time will acquire more data and the spatial resolution will be better when compared to a scan acquired over a shorter acquisition time. An acquisition with a higher frame rate will result in better temporal resolution than a scan acquired with a lower frame rate. The ~~transducers~~ elements 104 are focussed to acquire the adjacent scan planes 18 very close to each other spatially.
